Ans 1

Validation: Validation is a method to authenticate the user. JavaScript provides the facility to validate the form on the client-side so data processing will be faster than server-side validation.

```
<form name="myform" action="/action_page.php" onsubmit="return validateForm()" method="post" required>
```

```
  Name: <input type="text" name="fname">  
  <input type="submit" value="Submit">  
</form>
```

```
Function validateForm() {  
    var x = document.forms["myForm"]["fname"].value;  
    if (x == "") {  
        alert("Name must be filled out");  
        return false;  
    }  
}
```
